

Measuring Guide

Our covers are custom made to your specification.

We cannot be responsible for incorrect measurements or misinformation provided by the customer. By completing the ordering procedure you are committing to purchasing this cover as you have specified.

Please make sure to take measurements from your Hot Tub/Spa and **not** your existing lid as this may have stretched or expanded over time.

Dimension A & B – Length & Width

- When measuring your spa for a new cover, be sure to keep your tape measure straight at all times, we suggest taking measurements in at least 3 locations for each dimension to be sure.
- If dimension A and dimension B (length & width) are almost identical it is most likely your spa is a square spa.
- If you are in doubt of any sizing we suggest rounding up to the nearest cm. Your cover will sit fine up to 2.5cm larger than your dimensions. It is better to have a cover that is slightly larger than too small.

Dimension R - Corner Radius

The easiest way to measure your corner radius is to use a carpenter's square, however if you don't have one of these you can simply use a ruler and straight edge.

Remember the smaller the radius the more square the corners are. If you are unsure smaller is safer!

Dimension C & D - Measuring the straps

Our strap length is fully customisable to suit your spa and cover, please specify the length required when completing your spec sheet.

- Be sure to measure from the underside of your cover down to the top of the clip.
- We provide 4 new locking clips.

Dimension S - Measuring the skirt

The skirt is vital for retaining heat and protecting the acrylic on your spa.

- Make sure to measure the skirt so that is long enough for it to completely cover the acrylic.
- The skirt provides protection against UV rays to prevent any fading of your acrylic/spa.
- Keep in mind that spas sunk into decking may require a shorter skirt.
